PROFESSIONAL SUMMARY

Software engineer who owns bugs end-to-end on a live, multi-tenant enterprise ERP (**React 19, TypeScript strict, Vite**) — reproduce, root-cause across the frontend and API layers, fix, and gate with types and tests. I care more about understanding *why* something breaks than patching the symptom. Early, disciplined adopter of **AI-powered development**: AI agents do the heavy lifting, strict `tsc` / Vitest/Playwright gates keep them honest. Proof I finish what I start: a **deployed multi-tenant SaaS** and an **npm-published developer CLI**, both built solo.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript (ES6+), HTML5, CSS3, Python (basic), C/C++

AI-Assisted Development: Claude Code, GitHub Copilot, prompt engineering, agentic workflows, custom agents, MCP integrations, AI code review (`ai-diff-check`)

Frameworks & Libraries: React 19, React Router, Redux, TanStack Query v5, TanStack Table, React Hook Form, Zod, Zustand, Node.js, Express

Styling & UI: Tailwind CSS, shadcn/ui (Radix), Bootstrap, Material UI, responsive design, WCAG accessibility

Testing & Tooling: Vite, Vitest, Playwright, Git, GitHub, Azure DevOps, Docker, Vercel, Render

Data & Practices: REST APIs, MongoDB, JWT auth, multi-tenancy, component architecture, code review / PR workflow

AI-POWERED DEVELOPMENT

- Direct AI coding agents (**Claude Code**, GitHub Copilot, ChatGPT) like a tech lead across the full bug-to-PR cycle on real production work — reproducing issues, navigating a large unfamiliar codebase, triaging QA reports into frontend vs backend defects, and drafting fixes and tests — then reviewing and verifying every change myself before it ships.
- AI is a fast pair, not autopilot: strict `tsc` type-checks, production builds and Vitest/Playwright suites gate all AI-assisted code, so nothing reaches a PR unverified.
- Built my own AI tooling — **ai-diff-check**, an **npm-published CLI** (`npx ai-diff-check`) that reviews AI-written diffs for duplicated logic, dead exports, stubbed error handling and untested changes.

EXPERIENCE

Software Development Engineer — Intern · MSBC Group

Mar 2026 – Present

DWERP — an enterprise-scale, multi-tenant SaaS ERP that unifies sales, inventory, production, delivery and finance for the fenestration & glass-manufacturing industry. Frontend: React 19 · TypeScript (strict) · Vite · Tailwind · TanStack Query v5.

Own the full bug-to-release cycle on **DWERP** — a multi-tenant, RBAC-scoped enterprise ERP built on React 19 + TypeScript (strict).

- Debug and **root-cause production issues** through the component tree, the TanStack Query data layer and REST API contracts — fixing the underlying cause, not the symptom.
- Built the **role-based access-control (RBAC) access-management UI** — permission gating for modules, routes and actions across all **5 ERP modules**.

- Hardened complex create/edit workflows with typed **React Hook Form + Zod** validation aligned to backend contracts (eliminating a recurring class of **HTTP 400** failures), and delivered country-aware tax/bank/address configuration for **4 regions** (IN / UK / US / AUS).
- Refactored brittle code into reusable typed components, ran **spec-vs-implementation gap analysis** against PRD/BRD documents, **reviewed pull requests**, and gated every change with strict types and Vitest/Playwright.

PROJECTS

Quarters — Multi-tenant Hostel-Management SaaS

LIVE IN PRODUCTION

Complete SaaS designed, built and deployed **solo** — true org-scoped tenant isolation on every model, billing plans with trial limits, full payment lifecycle with PDF receipts, lead pipeline, dark mode. React · Node/Express · MongoDB Atlas · JWT · Vercel + Render.

Signet — IT Asset Management Platform

OPEN SOURCE

Enterprise-style asset platform with its own design system — dashboard analytics, asset registry with detail drawers, 3-step handover wizard with signed-acknowledgement PDF, RBAC-gated UI on a fully typed mock-API architecture. React 18 · TypeScript strict · TanStack Query v5 · Tailwind · Zod.

ai-diff-check — Review Gate for AI-written Code

NPM · 3,000+ DOWNLOADS

Published on npm — runs with a single `npx ai-diff-check`. Deterministic AST analysis flags duplicated logic, dead exports, stubbed error handling and untested changes; no cloud or LLM required. TypeScript · Node.js · AST · Vitest.

EDUCATION & TRAINING

Bachelor of Computer Application — Silver Oak University

2023 – 2025

CGPA: 8.6

MERN Stack Development Program — Tops Technologies, Ahmedabad

2025

LANGUAGES

English (Proficient) · Hindi (Native) · Gujarati (Basic)
